

Cellular Telemetry

Know what is happening at a remote location.

GRD - GSP Data Acquisition and Remote Control devices with Logical internal programming.

The family of GRD products allow control and supervision from a distance, through a cellular communication of data, any type of machine, control or process system, facilitating the implementation of remote telemetry system.

Using the series of GRD products, information can be acquired from different sensors, transducers, or data from a serial port and then the information can be transmitted to a cellular telemetry web server or customers own web server or control system.
